'Vax-Unvax: Let the Science Speak' — Why RFK Jr. and I Wrote This Book

The Centers for Disease Control and Prevention has never compared the health outcomes of vaccinated children to completely unvaccinated children, and the agency won't give independent researchers access to government data to conduct such a study. In "Vax-Unvax: Let the Science Speak," Robert F. Kennedy Jr. and Brian S. Hooker, Ph.D., provide a compendium of more than 100 studies comparing health outcomes of vaccinated versus unvaccinated children.

In May 2017, Robert F. Kennedy Jr. was invited to meet with Dr. Francis Collins and Dr. Anthony Fauci.

Accompanying Kennedy to the meeting were Del Bigtree, Informed Consent Action Network founder, attorney Aaron Siri and Lyn Redwood, R.N., MSN, president emerita of Children's Health Defense (CHD).

Several other U.S. Department of Health and Human Services (HHS) officials in the executive offices of the National Institutes of Health (NIH) accompanied Collins and Fauci.

For many years, Kennedy — CHD founder and chairman on leave — and many others had pointed out that HHS had not conducted the proper controlled-vaccine safety study to validate the incredible increase in the U.S. childhood vaccine schedule from 23 doses to 72 doses, or the increase in the number of vaccines the Centers for Disease Control and Prevention's (CDC) recommended child and adolescent immunization schedule.

This type of comparative trial is the gold standard in evaluating the safety of all types of pharmaceutical products.

When Kennedy asked Fauci to produce just one placebo-controlled study regarding the 16 vaccines comprising the vaccination schedule, Fauci had made quite a commotion, rifling through a series of Redweld file folders rolled in on a cart from the NIH archives.

Finally, in what appeared to be feigned exasperation, Fauci gave up and said he would send the studies in question to the meeting participants.

Of course, he never did.

Both Kennedy and Bigtree gave the HHS many opportunities to produce placebo-controlled studies evaluating childhood vaccine safety — but the agency never produced the studies.

Kennedy asked for them directly in a series of emails to Collins finally to be rebuffed in a curt and dismissive letter from Collins, sent in August 2017. So sweeping was the commitment against placebo-controlled trials for vaccine safety that six additional NIH officials signed the letter, which was also sent to Jared Kushner, senior adviser to then-President Donald Trump.

The NIH officials seemed proud of their commitment to sweeping vaccine safety issues under the rug.

Bigtree also sent a letter to HHS asking for placebo-controlled vaccine safety studies and the biennial reports required by Congress regarding improvements in vaccine safety according to the National Childhood Vaccine Injury Act of 1986.

After being similarly rebuffed by the agency, Bigtree submitted a Freedom of Information Act request for the latter information. After suing HHS in Federal Court, in a case represented by Kennedy and Siri, Bigtree finally received the concession on June 27, 2018:

> "The [Department's] searches for records did not locate any records responsive to your request. The Department of Health and Human Services (HHS) Immediate Office of the Secretary (OSS) conducted a thorough search of its document tracking systems.
>
> "The Department also conducted a comprehensive review of all relevant records in HHS Secretarial Correspondence records and Federal Records Centers that remain in the custody of HHS.
>
> "These searches did not locate records responsive to your request, or indications that records responsive to your request and in the custody of HHS are located at Federal Records Centers."

Kennedy didn't stop there, however. In 2019, he reached out to me in an effort to search the scientific and medical literature for any published research study where the health outcomes of vaccinated individuals were compared to those of unvaccinated individuals.

For each study identified, we assembled easy-to-understand graphics with key quotes taken directly from the publication.

Kennedy wanted the studies to speak for themselves with minimal commentary. He posted the results of this work on his Instagram account in real time. Over a nearly two-year period, we highlighted more than 70 studies, including some that intentionally made the comparison and some in which the comparison was unintentional.

After Kennedy was de-platformed from Instagram in 2021, we realized that what we had assembled was an important compendium of information that needed to be shared in book form.

An additional 30 studies were found through the COVID-19 era and the book "Vax-Unvax: Let the Science Speak" will be released Aug. 29 by Skyhorse Publishing. Click here to order your copy today.

This book is important for laypersons, practitioners, scientists and others to get an overview of studies where actual unvaccinated cohorts are used as control groups.

Most of the studies featured in the book are indexed in PubMed, the NIH National Library of Medicine. These are the studies that the CDC refused to do.

The CDC has the ability to compare vaccinated versus unvaccinated children with its private database, the Vaccine Safety Datalink (VSD). The VSD consists of records from more than 10 million individuals, including 2 million children — a portion of whom are unvaccinated.

Yet the CDC has never compared the health outcomes of vaccinated children to completely unvaccinated children — and the agency won't give independent researchers access to the VSD to complete such a study.

That is why Kennedy and I produced this compendium of studies — to expose to the public the real science behind the vaccinated cohorts are used as control groups.

The Defender on occasion posts content related to Children's Health Defense's nonprofit mission that features Mr. Kennedy's views on the issues CHD and The Defender regularly cover. In keeping with Federal Election Commission rules, this content does not represent an endorsement of Mr. Kennedy, who is on leave from CHD and is seeking the Democratic nomination for president of the U.S.

Any candidate for any political office (federal, state or local) who pledges to support repealing and nullifying the NCVA will have my vote for sure. We desperately need to go back to the time when Big Pharma companies were legally held 100% liable for the injuries and deaths that they and all of their products have been proven to cause.

Thank You for your unceasing work to open the eyes of the public, (although unlikely to awaken the most committed and true believers).

Thank you both for your never-ending difficult work on these critical health issues. Your findings are ready for a major breakthrough and change in this country. ❤️ RFK Jr's vision for America, and I hope and pray he is given the platform to awaken the others, and stay safe in the process!

Until we cut off the head of the snake these issues will continue and grow. Once Pharma companies are held responsible and liable for the results of their jabs this massive onslaught of vaccines will subside.
Until then Pharma has the perfect business model, role out a myriad of vaccines as fast as they can with no liability and get them into the childhood vaccine schedule where they are mandated. Somehow Pharma, the snake, will make vaccines as fast as they can until we say "no more, Stop!" Then we can get back to a healthy state.

Even my animal veterinarian told me all vaccines had the potential to cause injury and death. 1 in 1500 would drop dead before the needle was extracted. And we are injecting our infants on their birthday? And as far as vaxxed children compared to un-vaxxed ones, look at the health of children in the Amish community! I guess they don't matter because they don't dine on S-S.

Never in my life have I pre-ordered a book this fast before.
Reply Share

Diana Dillenard — 4 days ago
You know the answer, already. Unvaxxed kid and people don't suffer chronic illness hardly at all.

JAN. 18, 2023 Young teachers (COVID-19 vaccinated) who died suddenly during March 2023 -14 sudden deaths examined
In late 2021 and early 2022, teachers were mandated to take COVID-19 vaccines. There have been so many sudden deaths of teachers, I've had to split them up.

My partner and I are on opposing sides on the C19 issue. So, he was playing the Young Turks podcast, I think it was the Interside one. These guys had a very smug intellectually superior attitude. They were talking about Robert Kennedy Jr. and his book and how silly the talking heads had been on def fakthd the label 'conspiracy theorist' immediately realize they are talking turkey, where they get their info from the talking turks before them, and all the way down, with no basis of fact supported for their nonsensical opinions. They are getting away with it, but are on borrowed time, soon enough their foolishness will be apparent to a larger swath of society, although they will take cover in spin.

After Covid, it must initially be assumed that the CDC, NIH, and FDA are actually trying to harm US citizens. Any proposal made by them, or any action promulgated by them in the past, must be viewed with extreme suspicion.

Scientists have also plenty of flaws, but counterproductive to go to the opposite esoteric. Let the epistemologists of science explore. And the anecdotes of science too. Then the metaphysics of most skeptics, but its structured statistical inference with that (just that in special algebra explorations. And then ... shit the time has gone) no more time,

What vaccines are truly necessary for children? The only ones that make any sense to me are tetanus and polio.
Reply Share

Eric — 4 days ago edited Gaudenmour
Theres been no polio for decades and it isn't because of vaccines, its been because of sanitation and other factors. In fact the only polio cases there have been recently have been vaccine derived from polio vaccination as it has jumped from a weakened virus to a more virulent one.
Tetanus vaccines apparently do not work if you take them immediately after cutting your hand on something rusty, but we give them immediately after a cut that hasn't always. Why? I don't know. You would have to look at the studies on tetanus infected because it takes a couple of weeks to establish immunity. Further you would have to look at the studies on those who were going to be cutting themselves on something rusty? Probably very close to zero.
The only thing out there that concerns me as a parent is something like whooping cough, or pneumonia. You have to balance the risk of your child contracting something like that against severe mental disease or life long chronic illnesses from vaccination. Personally I'm not for or against vaccines no vaccines as I think the upside is not worth it relative to the risks.
The issue we have right now in the world is that parents dont actually understand the risks of childhood vaccines as they are portrayed as safe and effective, so they can weight the risks up against the benefits of some protection against pneumonia or whooping cough.

Florida Prophet — 4 days ago edited
Your premise reflects your acceptance of the establishment's position that a rusty nail causes tetanus. Any object that penetrates the skin - a shard of glass, a wooden splinter, a rose thorn, or a million other things - are just as likely to create a pathway for the bacteria to enter and infect. It has absolutely NOTHING to do with rust!
I mention this old wives tale by way of pointing out we are also told a number of untruths.
Reply Share

Eric — 4 days ago Florida Prophet
Perhaps. It is not a view I am married to. The point I am making however is that there is no real reason to give a 0-2 year old a tetanus shot, whether it is part of the schedule or not.
